                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondrial and/or by binding to the apoptosis-activating factor (APAF-1) (By similarity). SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCLIJULAR LOCATION: Outer mitochondrial membrane, intracellular and the substance of the control of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        similarity).

DOMAIN: The BH4 domain is required for anti-apoptotic activity for interaction with RAF-1 (By similarity).

for interaction with RAF-1 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and

DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity).

PTM: Phosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle (By similarity). In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated Kinases (By similarity). Dephosphorylated by protein phosphatase 2A (PP2A) (PP2A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and Bel-x(L).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MAQAGRTGYDNREIVMKYIHYKLSQRGYEWDVGDVDAAPLGAAPTPGIFSFQPESNPTPA
                         the apoptosis-activating factor (APAF-1). SUBUNIT: Forms homodimers, and heterodimers with BAX, Bcl-x(L). Heterodimerization with BAX requires intact
                                                                FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding t
             domains, and is necessary for anti-apoptotic activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TLATWLRRRGGWTDVLKCV-VSTKPGFRSHWL-VATLCS

anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bc12 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases.

Dephosphorylated by protein phosphatase 2A (PP2A).

Proteolytically cleaved by caspases during apoptosis. The ved protein, lacking the BH4 domain, has pro-apoptotic vity, causes the release of cytochrome c into the cytosol

                                                                                                                                                                                                                                                                                                                                        Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.
                                                                                                                                                                                                                                                                     TISSUE SPECIFICITY: In adult chicken expressed, in thymus, kidney, heart, ovary and brain, with the highest levels in thymus. In the embryo, highly levels expressed in all tissues the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                               release of cytochrome c from the mitochondria and/or the apoptosis-activating factor (APAF-1).

       FUNCTION: Potent inhibitor of cell death. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane. The Bcl-x(S) and

TISSUE SPECIFICITY: EXPRESSED IN MOST TISSUES: BCL-X(BETA)
SPECIFICALLY EXPRESSED IN CEREBELLUM, HEART, AND TYMUS. II
OVARY, THE PREDOMINANT FORM IS BCL-X(L), WITH A SMALL BUT
DETECTABLE LEYEL OF BCL-X(S).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBUNIT: Bcl-x(L) forms heterodimers with BAX, BAK and similarity). Heterodimerization with BAX does not seem required for anti-apoptotic activity (By similarity). SUBCELLULAR LOCATION: MITOCHONDRIAL MEMBRANES AND PERIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DOMAIN: The BH4 domain is required for anti-apoptotic activity. The BH1 and BH2 domains are required for both heterodimerization with other Bcl2 family members and for repression of cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            X82537; CAA57886.1;

                                                                                                                                                                                                                                                                                                                                                                                               "Quantification of controlling "; short-term hibernating myocardium.";
J. Mol. Cell. Cardiol. 31:147-158(1999).

-!- FUNCTION: Potent inhibitor of cell death. Inhibits activation caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane.

-!- SUBUNIT: Bcl-x(L) forms heterodimers with BAX, BAK and Bcl-2 (similarity). Heterodimerization with BAX does not seem to be required for anti-apoptotic activity (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T 11

                                                                                                                                                                                                                                                                                                                                                                                                                                        AND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING.

TISSUE SPECIFICITY: BCL-X(S) IS EXPRESSED AT HIGH LEVELS IN CELLS

THAT UNDERGO A HIGH RATE OF TUNOVER, SUCH AS DEVELOPING

LYMPHOCYTES. IN CONTRAST, BCL-X(L) IS FOUND IN TISSUES CONTAINING

LONG-LIVED POSTMITOTIC CELLS, SUCH AS ADULT BRAIN.

DOMAIN: The BH4 domain is required for anti-apoptotic activity.

The BH1 and BH2 domain are required for both heterodimerization

with other Bcl2 family members and for repression of cell death.

PTM: Proteolytically cleaved by caspases during apoptosis. The

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                            114

transforming protein bcl-2, splice form beta - human
N.Alternate names: apoptosis regulator bcl-2
C.Species: Homo sapiens (man)
C.Date: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 15-Oct-1999
C.Accession: B29409; I52566; D37332
R.TSujimoto, Y.; Croce, C.M.
Proc. Natl. Acad. Sci. U.S.A. 83, 5214-5218, 1986
A.Title: Analysis of the structure, transcripts, and protein products of bcl-2, A.Reference number: A29409; MUID:86259760; PMID:3523487
A.Reference number: MID:86259760; PMID:3523487
A.Residues: 1-205 cTSU>
A.Cross-references: GB:M13995; NID:9179368; PIDN:AAA51814.1; PID:9179369

CC protein, of the invention. Coding sequences for Bok or BH3i variants of protein can be introduced into cell populations to upregulate expression of the protein can be introduced into cell populations of the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular cardinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive and cother tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or constrates. Modulation of the gene activity in vivo is useful for custoriers. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive another tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 1999-327356/27

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok

                                                                                                                                                         This sequence is a mammalian Bok (BCl-2-related ovarian killer)
CC protein, of the invention. Coding sequences for Bok or BH3i variants of
CC protein, of the invention. Coding sequences for Bok or BH3i variants of
CC pro-apoptotic Bok-related protein can be introduced into cell populations
CC to upregulate expression of the proteins in order to induce apoptosis in
CC the cell population. This is useful for treatment of diseases where there
CC is hyperproliferation of reproductive tissue, e.g. uterine, testicular
CC and ovarian carcinomas, endometriosis, squamous and glandular epithelial
CC carcinomas of the cervix. Cell killing induced by Bok can be suppressed
CC by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok
CC protein can be used to elucidate apoptosis mechanisms in reproductive and
CC protein and transgenic animal are also useful for identifying ligands or
CC grophylaxis and therapy of, e.g. cancer and other proliferative
CC disorders. Bok genes are also useful for identification of cell type
Dased on expression. Identification of Bok as a new pro-apoptotic protein
CC with wide tissue distribution and heterodimerisation properties

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Qy
                                                                                                                               Bcl-2-like polypeptides (PEP1). The NAM1 and PEP1 may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Bcl-2-like polypeptides' expression. The NAM1 may be used to produce the soluble Bcl-2-like polypeptides by standard recombinant methodolgy. The polypeptides may also be used as antigens in the production of antibodies against Bcl-2 and in assays to identify modulators of Bcl-2 expression and activity. The anti-Bcl-2 antibodies and antagonists may be used to down regulate expression and activity. The anti-PEP1 antibodies may also be used as diagnostic agents for detecting the presence of Bcl-2 polyps in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). Disorders that may be prevented, diagnosed
                                                                              and/or treated by the above methods include, immunodeficiencies (e.g. a gammaglobulinemia and B cell lymphoproliferative disorder), autoimmune disorders (e.g. rheumatoid arthritis and Grave's disease), allergic
                            reactions, inflammations, respiratory diseases and cardiovascular disorders (a full list of disorders is given in the specification present sequence represents a human Bcl-2-like polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bcl-2-like polypeptide; autoimmune disorder; allergy; immunomodulatory; respiratory; cardiovascular; antiarthritic; immunostimulant; vaccine; immunosuppressive; antiinflammatory; gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                             invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antivired; antiallergic; hepatotropic; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, provention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, theumatoid attention and treatment of disease, multiple sclerosis, theumatoid attention and treatment of disease, multiple sclerosis, theumatoid
                                                                                                                                                                                                                                               Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB59711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the
                                                                                                                                                                                                                                                                                                                                                                     New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nootropic; neurpprotective; antiviral; antiallergic; l

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В
at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated proteins Tau and Big Tau, ubiquitin B, apolipoprotein E, microtubule. associated protein 2 (MAP2), neurofilament-L, neurofilament-M,
                                                                                                      multiple sclerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients,
                                                                                                                                                                          This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                     Diagnosing disease by detecting frameshift mutations in RNA corresponding protein mutations - used to diagnose cancer an neurological diseases, particularly Alzheimer's disease, and for treatment and prevention with specific ribozymes or wild
                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diabetes mellitus type II; microtubule associated protein; Tau; Big Ta ubiquitin B; apolipoprotein E; MAP2; neurofilament-L; neurofilament-M; neurofilament-M; presenilin I; presenilin II; call at tumour antigen; glial fibrillary acidic protein; GFAP; p53; semaphorin III; HUPF-1; bcl-2; B-cell leukemia/lymphoma 2-proto-oncogene; HMGP-C; NSP-A; high mobility group protein-C; neuroendocrine specific protein A.

The present sequence is human BCL2 from which a peptide capable of inhibiting BCL2 gene, or gene product, function in cell can be derived. The cDNA sequence encoding the peptide is sense oriented genetic suppressor element (GSE) for reversing

The GSE and its peptide product can be used to sensitise cancer cells to chemotherapeutic agents, and to increase apoptosis, especially for the treatment of cancer, but more generally to induce virus infected cell death, or to treat apoptosis related diseases of haematopoietic or neurological cells. The GSE peptide product or a recombinant construct encoding the GSE can be used to decrease BCL2 gene expression by exerting an anticancer effect, e.g. in cases of non-Hodgkin's lymphoma and B cell malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     76
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61
```

The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serin residue is substituted by alanine or aspartic acid. The protein increased apoptosis inhibitory activity compared with the wild t Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatm of disorders caused by apoptosis. The present sequence is a muta

                                                                                       The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence is a mutant

                                                                                                                               A human bc1-2 gene substantially free of introns is claimed. Also claimed is a substantially pure preparation of a protein having an N-terminal end encoded by the first exon of the human bc1-2 gene wherein said protein is bc1-2-alpha having about 239 (AAP80987) or 205 (AAP80988) AA residues. B-cell neoplasms which are associated with t(14:18) chromosome translocations cause an increase in expression of both the mRNA and the protein prods. of the bc1-2 gene. This is used to detect B-cell neoplasms including follicular lymphomas as well as other lymphomas. Bacterial isolates available as ATCC 67147 and 67148 can be used to express bc1-2 gene products alpha (AAN81292) and beta (AAN91293) resp. in bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of B-cell neoplasms - by extn. of proteins or RNA from B-cells and specific antibody or DNA probe

                                                                                                                                                                                                        A DNA construct comprising the bcl-2 coding sequence under control of elements allowing its expression is claimed. Myc-induced cell death can be inhibited in cultured cells by expressing bcl-2. Myc-induced cell death can be de inhibited in tumour cells by admin.
